

COVERAGE IN PART 12

See [Frontispiece One](#) of this volume for base map credits and an areal portrayal of the regions covered by this bibliography

— Longer, bold orange line delineates the Colorado River from Glen Canyon Dam to the U.S.–Mexico boundary, along which are located existing or proposed major water-management projects covered in [Part 12, Section 1](#) of this bibliography. This line also depicts the corridor along which are located infrastructural projects not related to water management, which are covered in [Part 12, Section 2](#).

— Shorter, bold red lines delineate those parts of existing water-management projects that derive from the Colorado River; lines are limited to the area covered by [Part 12, Section 1](#). The **—** light orange, curved double-lined path roughly delineates the area affected by the early-1900s anthropomorphic beakout of the Colorado River into the Salton Sink, which also resulted in the re-formation of the Salton Sea. The bibliography also covers the Imperial and Mexicali Valleys.
