- 1885 *11.613* [Report of fresh-water sponges along Colorado River 59 miles south-southwest from Yuma.] *The Museum* (Philadelphia), 1(3) (July): 39. ["Mr. Edward Potts reports the discovery of sponges (*Meyenia plumosa*, var.—) growing on trees (*Strombucarpus pubescens* on the Colorado river, 59 miles S. S. W. from Fort Yuma, California, by Dr. Edward Palmer. The sponges are nearly spherical in shape, and some of them are almost six inches in diameter, the dark masses in a dried state hanging from the pendant boughs by thousands, like wasps' nests. Only during portions of May and June are the branches of the trees under water, and it is, therefore, believed that the sponges are developed from the gemmule or statoblast within the short period of three to six weeks." SECTION 2: GEOLOGY, PALEONTOLOGY, HYDROLOGY, AND RELATED DISCIPLINES

NOTES FOR PART 11, SECTION 2

IN MEXICO, the Río Colorado, now in the best of times just a pitiful remnant of the Colorado River, eventually passes into the northernmost portion of the Gulf of California. Although it might not seem necessary to include the gulf in this bibliography, its northern end has for millennia been influenced by the outflow of the Colorado River, flush with the mighty, silt- and sand-laden torrents from the continental interior, perhaps at times influenced by the formation of geologically temporary lakes enroute—and, today, absolutely and contemptuously impacted by the complete cessation of river flow, every last drop shunted off to farms and cities, which has had impacts on the environment of the northern gulf. Geologically, the tectonic structure of the gulf is in fact a part of the Salton Trough region; thus, to separate the northern gulf from the lower Colorado is impossible.

Citations in Section 2 that pertain to the flooding of the Salton Sea relate to the natural breakout of the Colorado River into the Salton Sink in 1891 and historically earlier events. (For publications that relate to the anthropogenic breakout of the Colorado during 1905-1907 see [Part 12, Section 1](#) of the bibliography.)

Matters relating to water level studies and supplies to Lake Mead will be found in [Part 12, Section 1](#).

To help distinguish items that are *solely* about Mexico, Item numbers in *colored italics* within Section 2 (for example, *11.16239*) denote these geographically restricted items.⁵⁹ Item numbers that are not italicized in in this Section pertain to the lower Colorado River region of the U.S. or the U.S. and Mexico together.

Seismological studies, including those of the effects of earthquakes with epicenters in Mexico, are generally binational in scope. For example, the well-studied 4 April 2010 M_w 7.2 El Mayor-Cucapah earthquake, though with its epicenter in Baja California, produced significant effects in southern California as well. Accordingly, only those citations which are demonstrably restricted to studies in Baja California are noted with Item numbers in colored italics.

⁵⁹ *Colored italics* are used for aesthetic and pragmatic reasons; color to stand out more on the page, italics in the event that a page in this bibliography is reproduced without the benefit of color.

PART 11. ENVIRONMENT, NATURAL HISTORY, AND SPECIAL SCIENTIFIC, TECHNICAL, OR CULTURAL ISSUES

SECTION 2: GEOLOGY, PALEONTOLOGY, HYDROLOGY, AND RELATED DISCIPLINES

Items that pertain to groundwater supplies and their management in the Imperial Valley and binational border areas are included in this section.

In the lower Colorado River region, much of the contemporary history of mining—or more precisely the history of mining claims, entrepreneurs, and the fleeced—is scattered densely and often nearly invisibly in the professional and trade magazines of the nineteenth to twentieth centuries. The pertinent citations in this section of *THE GRAND CANON* frankly only suggest the total of what must appear in (very fine) print, and as yet most are not rediscovered for this bibliography.

Citations that pertain to the Peach Springs Tuff, named originally for occurrences in northwestern Arizona, are for the sake of bibliographical convenience cited in this section. The Peach Springs Tuff type locality is near Peach Springs, Mohave County, Arizona, and thus falls more properly into Part 21 of this bibliography. However, the unit has more notably been the subject of detailed studies and correlations throughout the Arizona–Nevada–California region, the tuff source area being identified in the Silver Creek caldera of the southern Black Mountains; a majority of the published work pertains to those correlated occurrences and identification of source area, which occur mostly in the lower Colorado River region.

Many citations from publications produced by the Geological Society of America include references to supplementary material in the Geological Society of America’s Data Repository. Originally, this material could be requested by mail application to the society, and in the early 1990s a compilation of Data Repository items was available on microfiche, but today all of it is accessible online at <https://www.geosociety.org/datarepository/>).

This section of the bibliography contains a great deal of taxonomic nomenclature of fossil organisms; the so-called binomial nomenclature of genera and species (*Genus species*, in italics) and capitalized proper names of higher taxonomic groups (like phyla, classes, and families, not italicized). Although a citation will be exactly as printed, in notes that may follow it I have taken the opportunity to clarify some of the nomenclatural conventions that may not be intuitive to those who do not practice in these fields. I have indicated as best as I have been able the newly introduced taxa in a publication that come from localities within the geographic embrace of this bibliography. To disambiguate variant usages, in the notes that I append to some citations I use spelled-out phrases to bring attention to these new taxa. For example, “new species” is used instead of the nomenclaturally more conventional “n. sp.,” “nov. sp.,” “sp. n.” or “sp. nov.” (which in any case are synonymous terms); likewise for “new genus,” “new ichnospecies,” or any similar usage with a taxonomic name. In this fashion, too,
